

Notes for the Soil's Guardian Allies

Angel's Touch is a natural source of humic acid and natural plant bio-stimulants from the sea that trigger responses such as stress resistance, better root development, improved absorption of essential micro-nutrients, lower seedling mortality, improved cloning, greater trichome production, and aid cannabis in the production of essential enzymes.
It's a water soluble powder (WSP).

Directions: We recommend mixing two level teaspoons of the powder/gallon of water (dissolved in a small amount of warm water first). Apply to soil (not to foliage). Weekly applications are recommended from seed (or clone) to harvest. Mix only what is needed for the immediate application. Flush irrigation systems after each use.

Note: For more info, detailed mixing, and use instructions visit our website below.

Angel's Touch is available in 11 oz. containers
